Bacteria And Viruses Review Answer Key

Bacterial infections are caused by bacteria either breaking down the body's tissues for food or releasing harmful toxins into the body. A viral infection results when viruses infect body cells, take over their cellular functioning, and begin replicating themselves. In the process, viruses can destroy body cells.

Test Review for Bacteria and Viruses Answer Section

Viruses are not living organisms, bacteria are. Viruses only grow and reproduce inside of the host cells they infect. When found outside of these living cells, viruses are dormant. Their "life" therefore requires the hijacking of the biochemical activities of a living cell. Bacteria, on the other hand, are living organisms that consist of single cell that can generate energy, make its own food, move, and reproduce (typically by binary fission). This allows bacteria to live in many places ...

Virus vs. Bacteria: What is the Difference? | Merriam-Webster

The life cycle of these viruses can be activated under certain conditions, causing the synthesis of viral proteins to begin, and producing new copies. The virus that causes herpes (herpes virus) is an example of a virus that stays in an inactive state and is sometimes activated.

Viruses Review - Biology Q&As

Bacteria are intercellular organisms (i.e. they live in-between cells); whereas viruses are intracellular organisms (they infiltrate the host cell and live inside the cell). They change the host cell's genetic material from its normal function to producing the virus itself.
